5	Char	ngelog 13
	5.1	Version 3.0.0 (2018-08-08)
	5.2	Version 2.0.0 (2016-08-08)
	5.3	Version 1.0.0 (2016-04-01)
	5.4	Version 0.4.0 (2012-10-15)
	5.5	Version 0.3.2 (2012-07-28)
	5.6	Version 0.3.1 (2012-07-28)
	2.0	VOISION U.J.1 (4U14-UJ-1U)

Installation

The SDK currently supports Python 2.7 and Python 3.4-3.7. The requests package is required.

We recommend using pip and virtualenv to install the SDK. Please note that the SDK's Python package is called **facebook-sdk**.

1.1 Installing from Git

For the newest features, you should install the SDK directly from Git.

virtualenv facebookenv
source facebookenv/bin/activate
pip install -e git+https://github.com/mobolic/facebook-sdk.git#egg=facebook-sdk

1.2 Installing a Released Version

If your application requires maximum stability, you will want to use a version of the SDK that has been officially released.

virtualenv facebookenv
source facebookenv/bin/activate
pip install facebook-sdk

Integrating the SDK with Other Frameworks

2.1 Flask

The examples directory contains an example of using the SDK in Flask.

2.2 Google App Engine

Because the SDK uses requests (which requires socket support in Google App Engine), you will need to enable billing.

2.3 Tornado

The examples directory contains an example of using the SDK in Tornado.

Facebook SDK for Python Documentation, Release 3.0.0							

Support & Development

3.1 Mailing List

Questions about the SDK should be sent to its Google Group.

3.2 Reporting Bugs

Bugs with the SDK should be reported on the issue tracker at Github. Bugs with Facebook's Graph API should be reported on Facebook's bugtracker.

3.2.1 Security Issues

Security issues with the SDK that would adversely affect users if reported publicly should be sent through private email to the project maintainer at martey @ marteydodoo.com (GPG key ID is 0x2cd700988f74c455).

Facebook SDK for Python Documentation, Release 3.0.0	

API Reference

This page contains specific information on the SDK's classes, methods and functions.

4.1 class facebook.GraphAPI

A client for the Facebook Graph API. The Graph API is made up of the objects or nodes in Facebook (e.g., people, pages, events, photos) and the connections or edges between them (e.g., friends, photo tags, and event RSVPs). This client provides access to those primitive types in a generic way.

You can read more about Facebook's Graph API here.

Parameters

- access_token A string that identifies a user, app, or page and can be used by the app to make graph API calls. Read more about access tokens here.
- timeout A float describing (in seconds) how long the client will be waiting for a response from Facebook's servers. See more here.
- version A string describing the version of Facebook's Graph API to use. The default version is the oldest current version. It is used if the version keyword argument is not provided.
- proxies A dict with proxy-settings that Requests should use. See Requests documentation.
- session A Requests Session object.

```
import facebook
graph = facebook.GraphAPI(access_token="your_token", version="2.12")
```

4.1.1 Methods

get_object

Returns the given object from the graph as a dict. A list of supported objects can be found here.

Parameters

- id A string that is a unique ID for that particular resource.
- **args (optional) keyword args to be passed as query params

Examples

```
# Get the message from a post.
post = graph.get_object(id='post_id', fields='message')
print(post['message'])
```

get objects

Returns all of the given objects from the graph as a dict. Each given ID maps to an object.

Parameters

- ids A list containing IDs for multiple resources.
- **args (optional) keyword args to be passed as query params

Examples

```
# Get the time two different posts were created.
post_ids = ['post_id_1', 'post_id_2']
posts = graph.get_objects(ids=post_ids, fields="created_time")

for post in posts:
    print(post['created_time'])
```

```
# Get the number of people attending or who have declined to attend
# two different events.
event_ids = ['event_id_1', 'event_id_2']
events = graph.get_objects(ids=event_ids, fields='attending_count,declined_count')
```

(continues on next page)

(continued from previous page)

```
for event in events:
    print(event['declined_count'])
```

search

https://developers.facebook.com/docs/places/search

Valid types are: place, placetopic

Parameters

- type A string containing a valid type.
- **args (optional) keyword args to be passed as query params

Example

get connections

Returns all connections for a given object as a dict.

Parameters

- id A string that is a unique ID for that particular resource.
- connection_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts. If left empty, get_connections will simply return the authenticated user's basic information.

Examples

```
# Get the active user's friends.
friends = graph.get_connections(id='me', connection_name='friends')
# Get the comments from a post.
comments = graph.get_connections(id='post_id', connection_name='comments')
```

get_all_connections

Iterates over all pages returned by a get_connections call and yields the individual items.

Parameters

- id A string that is a unique ID for that particular resource.
- connection_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts.

put_object

Writes the given object to the graph, connected to the given parent.

Parameters

- parent_object A string that is a unique ID for that particular resource. The parent_object is the parent of a connection or edge. E.g., profile is the parent of a feed, and a post is the parent of a comment.
- connection_name A string that specifies the connection or edge between objects, e.g., feed, friends, groups, likes, posts.

Examples

put comment

Writes the given message as a comment on an object.

Parameters

- object_id A string that is a unique id for a particular resource.
- \bullet message A string that will be posted as the comment.

Example

```
graph.put_comment(object_id='post_id', message='Great post...')
```

put like

Writes a like to the given object.

Parameters

• object_id - A string that is a unique id for a particular resource.

```
graph.put_like(object_id='comment_id')
```

put_photo

https://developers.facebook.com/docs/graph-api/reference/user/photos#publish

Upload an image using multipart/form-data. Returns JSON with the IDs of the photo and its post.

Parameters

- image A file object representing the image to be uploaded.
- album_path A path representing where the image should be uploaded. Defaults to /me/photos which creates/uses a custom album for each Facebook application.

Examples

delete object

Deletes the object with the given ID from the graph.

Parameters

• id - A string that is a unique ID for a particular resource.

Example

```
graph.delete_object(id='post_id')
```

get_permissions

https://developers.facebook.com/docs/graph-api/reference/user/permissions/

Returns the permissions granted to the app by the user with the given ID as a set.

Parameters

• user_id - A string containing a user's unique ID.

```
# Figure out whether the specified user has granted us the
# "public_profile" permission.
permissions = graph.get_permissions(user_id=12345)
print('public_profile' in permissions)
```

get_auth_url

https://developers.facebook.com/docs/facebook-login/manually-build-a-login-flow

Returns a Facebook login URL used to request an access token and permissions.

Parameters

- app_id A string containing a Facebook appplication ID.
- canvas_url A string containing the URL where Facebook should redirect after successful authentication.
- perms An optional list of requested Facebook permissions.

```
app_id = "1231241241"
canvas_url = "https://domain.com/that-handles-auth-response/"
perms = ["manage_pages", "publish_pages"]
fb_login_url = graph.get_auth_url(app_id, canvas_url, perms)
print(fb_login_url)
```

Changelog

5.1 Version 3.0.0 (2018-08-08)

- Add support for Python 3.6 and 3.7.
- Remove support for Python 2.6 and 3.3.
- Add support for Graph API versions 2.8, 2.9, 2.10, 2.11, 2.12, and 3.0.
- Remove support for Graph API versions 2.1, 2.2, 2.3, 2.4, 2.5, and 2.6.
- Change default Graph API version to 2.7.
- Add support for requests' sessions (#201).
- Add versioning to access token endpoints (#322).
- Add new *get_all_connections* method to make pagination easier (#337).
- Add new get_permissions method to retrieve permissions that a user has granted an application (#264, #342).
- Remove *put_wall_post* method. Use *put_object* instead.
- Add search method (#362).
- Rename auth_url method to get_auth_url and move it into the Graph API object (#377, #378, #422).

5.2 Version 2.0.0 (2016-08-08)

- Add support for Graph API versions 2.6 and 2.7.
- Remove support for Graph API version 2.0 and FQL.
- Change default Graph API version to 2.1.
- Fix bug with debug_access_token method not working when the GraphAPI object's access token was set (#276).
- Allow offline generation of application access tokens.

5.3 Version 1.0.0 (2016-04-01)

- Python 3 support.
- More comprehensive test coverage.
- Full Unicode support.
- · Better exception handling.
- · Vastly improved documentation.

5.4 Version 0.4.0 (2012-10-15)

- Add support for deleting application requests.
- Fix minor documentation error in README.
- Verify signed request parsing succeeded when creating OAuth token.
- Convert README to ReStructuredText.

5.5 Version 0.3.2 (2012-07-28)

- Add support for state parameters in auth dialog URLs.
- Fixes bug with Unicode app secrets.
- Add optional timeout support for faster API requests.
- Random PEP8 compliance fixes.

5.6 Version 0.3.1 (2012-05-16)

- Minor documentation updates.
- Removes the develop branch in favor of named feature branches.

This client library is designed to support the Facebook Graph API and the official Facebook JavaScript SDK, which is the canonical way to implement Facebook authentication. You can read more about the Graph API by accessing its official documentation.
